

MATOBO CONSERVATION SOCIETY
CHECKLIST FOR THE FLORA (TREES & SHRUBS) OF THE MATOBO HILLS

APPRECIATION

This material was prepared by the MATOBO CONSERVATION SOCIETY
from chapter 7 of the book

“THE NATURAL HISTORY OF THE MATOBO HILLS” ISBN 978-0-7974-9815-0

with the approval of the
NATURAL HISTORY MUSEUM OF ZIMBABWE

The Matobo Conservation Society, a registered Welfare organisation, is committed to the conservation, appreciation and sustainable use of the natural and cultural resources within the Matobo Hills region. For more information (a) on this checklist and (b) the book “THE NATURAL HISTORY OF THE MATOBO HILLS” , write to: The Matobo Conservation Society, PO Box FM 648, Famona, Bulawayo or email matoboconservationsociety@gmail.com

INTRODUCTION

Information provided by

RG Stephens, B Drummond, K Blake, I McCausland, J Timberlake

Sketches were done by Mary Friend

The Matobo Hills covers an area of about 3,100 square kilometres, and even within such a relatively small area there is wide botanic variety. This ranges from the extreme desert conditions found on the exposed "dwalas" or whale back hills, through grassland and woodland in the broad valleys to areas of thick forest and wetlands in the high eastern hills. The hills range in altitude from 1,564m above sea level, in the north east, to 1,115m in the south west. Rainfall follows a similar pattern, with the eastern hills recording an average in excess of 800mm, and the southwest as little as 400mm. Due to the runoff from the rocks, the

effective rainfall in the valleys is considerably higher. The combination of altitude and rainfall has a profound impact on the distribution of plants in general, and of trees in particular. Temperatures range from a mean summer maximum of 26.3C to a mean winter maximum of 17C. Frost can occur in winter, but never snow. This impacts on the growth of trees in some valleys.

MATOBO CONSERVATION SOCIETY
CHECKLIST FOR THE FLORA (TREES & SHRUBS) OF THE MATOBO HILLS

The granite gives rise to a pale coloured sand, not particularly rich, but well drained. In valleys, compost has enriched the soil, whilst vleis generally contain good soil. This checklist has all tree species to be found in the Matobo Hills. Just a glance will show the range of species, from the drought resistant Baobab (*Adonsonia digitata*) to the Common Tree Fern (*Cyathea dregei*). The eastern hills are dominated by the Mountain Msasa/Acacia (*Brachystegia tamarindoides*) whilst in the western hills the Round-leaved Mukwa (*Pterocarpus rotundifolius*) is the most common tree. There are 13 species that were first scientifically described in the Matopos, whilst the hills also represent the westernmost outlier of several plant species from the Eastern Highlands. All told, this makes the area a place of intense interest for the professional and amateur botanist alike.
